TITLE: Programming of machines with pulse-spacing system of preset control

SOURCE: Stanki i instrument, no. 6, 1963, 18-19

TOPIC TAGS: preset control, metalworking machine, pulse-spacing system, code converter, automatic computer

ABSTRACT: Techniques were developed at Sverdlovskiy proyektno-tehnologicheskiy institut (Sverdlovsk Design and Planning Technological Institute) to modernize universal and specialized metalworking machines by introducing the preset control system. Modernized machines performed accurately and dependably. This was especially true when the pulse-spacing system of the ENIMC preset control was applied. Programs for machines were computed and recorded by special equipment at the Institute. The recording was done on the code converter LKP-01F, the recording panel PZK, the reproduction panel PRS-1-58, the control desk and the punching mechanism P-23. The authors describe all improvements and adjustments used to eliminate the shortcomings of this equipment. The computing and recording

Card 1/2

L 13528-63

ACCESSION NR: AP3002758

of the program took a total of 55-60 hours, with half of this time spent on keyboard automatic computers of the "Mercedes" and "Rheinmetal" type. It is concluded that the processing of data by keyboard operated automatic computers is often economical and expedient. Orig. art. has: 2 figures.

Russian abstract obtained in the conventional determinations of
volatile matter in non fusible coals and anthracites, with and
without preliminary briquetting and addition of sand,
asbestos and kerosene, by heating a sample over a gas
flame. Results accurate to 0.3% are said to be possible
on heating a 1 g. sample in the Matveev furnace and a
Natalia at 900° for 30 min. The powdered sample is weighed
in a Pt boat and is covered with another boat with a 3
mm. perforation and ignited in a quartz tube. Equally
good results can be obtained by igniting a sample in a
gas flame over a crucible furnace (illustrated) at 900° for 7
min, with coal pressed into a briquet and powdered anthracite
soaked with kerosene.] Chas. Blane

"Prophylaxis of Manganese Poisoning in Steel Foundries."

Gigieno. 1 26-29, Jan. . 1950.

Periodical examination of the personnel working in a steel foundry showed that a considerable percentage of the workers were suffering from manganese poisoning. The usual clinical manifestations were general debility, headache, and aches in the limbs.

It was found that the air of all the compartments of the foundry was to a certain degree contaminated with manganese. The following recommendations were therefore made.

A thorough and direct ventilation should be installed above the places where manganese steel is heated. The roofs of the foundry buildings must be high built up and walls provided with sufficient windows to promote air movement. The chimneys should be built sufficiently high to secure ventilation by this route. Periodical examination of the personnel of the foundry is necessary to detect early cases of manganese poisoning.

Abstract : A summary of the research of the Kiev physician, Zakhariy Khrisanovich Zenkevich in the fields of the etiology and epidemiology of infections. He pointed out the various means of transmitting infections: droplet, contact, through articles of everyday home life, and others; carried on observations on the variability of microorganisms under the influence of changes of the conditions of the external environment, etc. The research of Zenkevich on tuberculosis produced great interest: in 1883 he put into practice for the first time the use of fuchsin for staining tuberculosis

Title : Malignant Periosteal Osteoma.

Orig Pub : Vestn. rentgenol. i radiol., 1957, No 3, 66-75.

Abstract : In 6 patients aged 21-47 periosteal osteoma was located mostly on the level of metadiaphysis (proximally on shoulder, 2; distally on thigh, 3; on diaphysis of fibula, 1). Especially characteristic is the discrepancy between the "soft" clinical picture and considerable roentgenologic changes (muff-shaped osseous deposits with polycyclic outside contours). The growth of the tumor is slow; the periosteal reaction and osteoporosis which accompany sarcomas are absent. By histologic examination, the osteoid structure of the tumor was discovered; but between the bone trabecula, fibrous tissue rich in vessels with spindle-
